

Hangman Game Project Report

This project is a Hangman Game developed using Java and JavaFX. The aim of the game is to guess the hidden word by entering letters. For every incorrect guess, a new part of the hangman is drawn, bringing the player closer to losing the game. The game ends when the player successfully guesses the word or when the hangman drawing is completed.

Project Design

The application was developed using a graphical user interface created with JavaFX. The game randomly selects a word from a predefined word list. The user enters letters through a text field and submits them using a button.

Main components:

- TextField for user input
- Labels for game messages
- Buttons for game actions
- JavaFX Stage and Scene for the interface

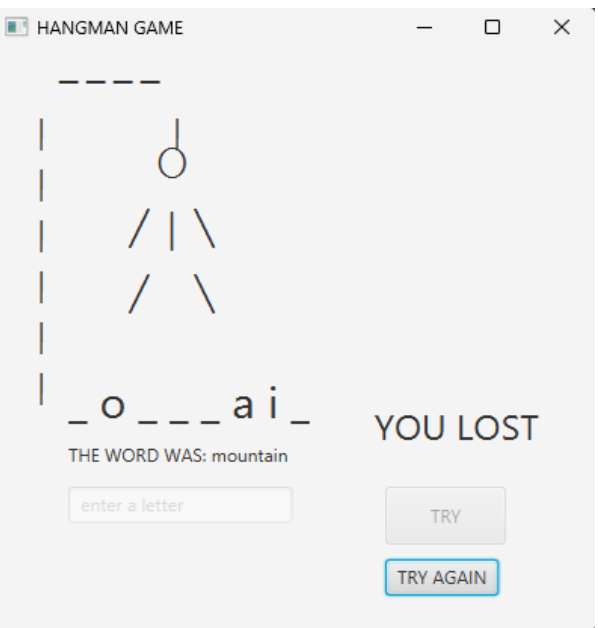

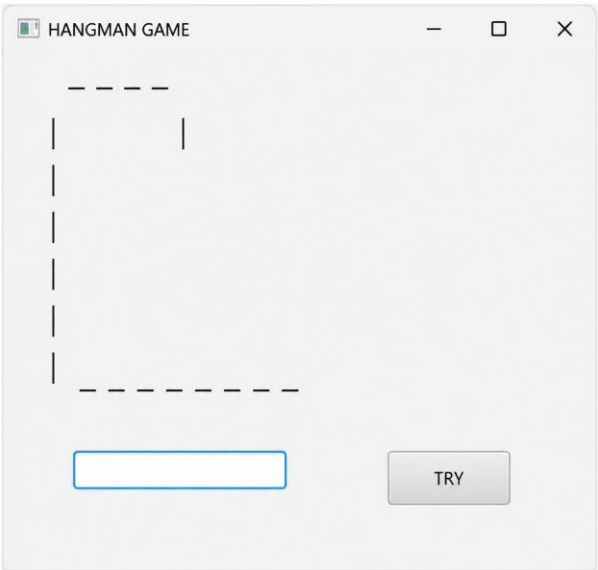

Game Logic

The game starts by selecting a random word.

Features:

- Hidden word display using underscores
- Correct letter detection
- Incorrect letter detection
- Hangman drawing progression
- Win and lose conditions
- Try Again functionality
- Invalid character validation
